

Description:

Failure on the factory floor!! One box of 'deluxe' ball-bearings has been mixed in with all the boxes of 'normal' ball-bearings! We need your help to identify the right box!

Information

What you know about the bearings:

- 'deluxe' ball-bearings weigh exactly 11 grams
- 'normal' ball-bearings weigh exactly 10 grams
- Besides weight, both kinds of ball-bearings are identical
- There are (effectively) infinite bearings in each box
- Each box contains exclusively one type of bearing (either regular, or 'deluxe')

To help you identify the right box, you also have access to a *Super Scale*™ which will tell you the exact weight of anything you give it. Unfortunately, getting it ready for each measurement takes a long time, so you only have time to use it once!

Task

Write a function which accepts two arguments:

- `bearings`: A list of the bearing types contained in each 'box'. (length between 1 and 200 inclusive)
- `weigh`: a function which accepts any number of arguments, returning the total weight of all. Can only be used once!

Your function should identify and return the single 'deluxe' bearing sample from `bearings`.

Example

```
function identifyBB(bearings, weigh) {
  const [a, b, c] = bearings;
  if ( weigh(a, b) == 20 )
    // bearings 'a' and 'b' must both be 10, so 'c' must be deluxe
    return c;
  else if ( weigh(a) == 10 ) // Error: weigh has already been used!
    return b;
  else
    return a;
}
```
