

Description:

You will be given a string and your task is to check if it is possible to convert that string into a palindrome by removing a single character. If the string is already a palindrome, return "OK". If it is not, and we can convert it to a palindrome by removing one character, then return "remove one", otherwise return "not possible". The order of the characters should not be changed.

For example:

```
"abba"    -> "OK"           - this is a palindrome  
"abbaa"   -> "remove one"   - remove the 'a' at the extreme right  
"abbaab"  -> "not possible" - cannot be made a palindrome
```

Good luck!
