

Description:

Given a string, return the minimum number of parenthesis reversals needed to make the parentheses balanced.

For example:

```
solve(")(") = 2 // Reverse ")" to "(" and "(" to ")". These are 2 reversals.  
solve("(((())") = 1 // Reverse one "(" to ")" to make the string balanced.  
solve("(((") = -1 // It is not possible to form balanced parentheses, so return -1.
```

Each character will be either (or).

More examples in the test cases.

Good luck.
